

Tango works where logistics still happens: on the phone.

A real-time voice agent that turns conversations into verified operational commitments.

The important part of logistics never made it into the system.

Quotes, changes and driver updates are still resolved by whoever answers the phone.

NO RECORD

What was agreed lives in memory, a note or a transcript.

NO PARALLELISM

Every urgent shipment waits for a human to hold another call.

NO CONTROL

A phone promise can drift away from the current operational constraints.

A mandate gives Tango a clear lane to operate.

1

Mandate

Price cap, pickup window and conditions are confirmed by a human.

2

Call

Tango contacts authorized carriers and negotiates in real time.

3

Validate

The server compares only valid offers against the active mandate.

4

Commit

The selected booking and evidence become durable operational facts.

The agent negotiates. The server decides what becomes true.

TANGO MAY

**Ask, clarify, negotiate
and confirm what it
heard.**

THE SERVER CHECKS

**Identity · active mandate ·
price · pickup window ·
state transition.**

THE LEDGER KEEPS

**Mandate versions ·
calls · quotes · booking
· escalation context.**

A carrier never receives the hidden price cap, and no model response writes to the database directly.

The voice path is real-time. The operation is durable.

Now we prove the ugly cases live.

01

Two carrier calls

Tango requests and compares live quotes under one mandate.

02

A change arrives

A carrier calls in with a pickup delay; Tango evaluates the window and updates the operation only when allowed.

03

The judge pushes outside the mandate

Urgency, sweet talk or a higher price cannot create a commitment. Tango declines or hands the live call to a human.

Trial by fire: a judge can improvise the other side of the call. The authority boundary remains the same.

The last mile of logistics is a phone call. Now it has an operating system.

ACTS

inside a human mandate

RECORDS

what actually became true

ESCALATES

before an exception becomes a promise

The result is not a transcript. It is a verified operation the team can act on.
